# Intelligent mistakes?

- mistake:
  - an action resulting from defective judgment, deficient knowledge or carelessness, a misconception or misunderstanding
- intelligent
  - exercising good judgment, showing mental resourcefulness, being well-informed
- · intelligent mistake
  - action based on a faulty premise, with the best of intentions, but with adverse consequences

DG

- Automation should find lots of bugs
- Automation comes out of a box (or download)
- · Let's automate all of our manual tests
- ROI is essential for automation
- Testing tools are testers' tools

# Good idea? Automation should find lots of bugs

- · Seems very sensible
  - we are automating tests
  - tests find bugs
  - automation is more thorough and faster
  - therefore, automation should find more bugs
    - and quicker
- Problems
  - what tests are we automating?
  - what does automation actually give us?

DG

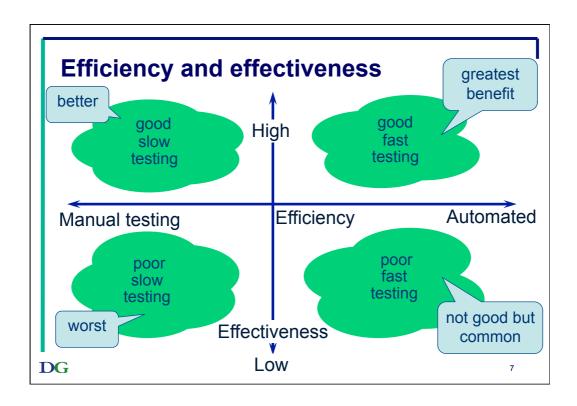

# **Automation success = find lots of bugs?**

- tests find bugs, not automation
- automation is a mechanism for running tests
- the bug-finding ability of a test is not affected by the manner in which it is executed
- this can be a dangerous objective
  - especially for regression automation!

Automated tests	Manual Scripted	Exploratory	Fix Verification
9.3%	24.0%	58.2%	8.4%

**DG** 

Experiences of Test Automation, Ch 27, p 503, Ed Allen & Brian Newman

### When do automated tests find bugs?

- when the first run of a given test is automated
  - Test-Driven Design in Agile (& BTDD)
  - Model-Based Testing (MBT), automated test design, monkey testing, exploratory test automation
  - keyword-driven (e.g. users populate spreadsheet)
- find bugs in parts we wouldn't have tested?
  - indirect result of automation
  - direct result of running more tests

DG 8

- Automation should find lots of bugs
- Automation comes out of a box (or download)
  - · Let's automate all of our manual tests
  - ROI is essential for automation
- Testing tools are testers' tools

# Good idea? Automation comes out of the box (or download)

- Seems very sensible
  - automation gives great benefit, success stories
  - spending a lot on the tool must guarantee great benefits
  - all we need to do is "get the right tool"
- Problems
  - technical issue: what testware architecture is right for your organisation? (hint: not the tool's)
  - management issues: staffing, support, resources

DG

# **Automation should fit your organisation**

- · your own testware architecture is critical
  - a poor architecture gives high maintenance cost
    - most frequent cause of abandoned automation/ shelfware
  - two layers of abstraction
    - technical: for long life
    - human: for wide use
  - using the tool's architecture ties you to that tool [version]

DG

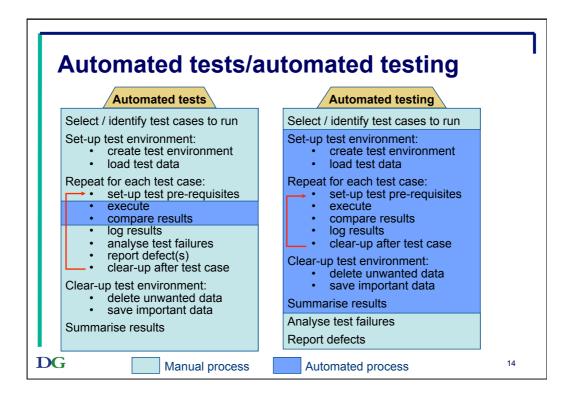

11

#### It's not about the tool no such thing as "the right tool" or "best tool" - what's "the best car"? commercial tools? investment in good automation good benefits good benefits high cost moderate cost benefits poor benefits poor benefits high cost low cost tool cost budget open source tools? DG 12

#### It takes time and effort to succeed

- management support is critical
  - high level managers need to understand automation capability & limitations, and have realistic expectations
  - building good automation is a learning process
  - "people issues" people use the automation, people develop the automation

 $\mathbf{DG}$ 

- Automation should find lots of bugs
- Automation comes out of a box (or download)
- Let's automate all of our manual tests
- ROI is essential for automation
- Testing tools are testers' tools

15

### Good idea? Let's automate all of our tests

- · Seems very sensible
  - we already have lots of tests being done manually
  - automation would be much quicker
  - we can be completely automated, no need for manual tests [testers?!]
- Problems
  - what tests are you automating?
  - what are you missing by automating [only] existing tests?

**DG** 

### **Tools will replace testers?**

- "we can reduce the number of testers once we have the tool"
  - what are your testers like?
    - · mindless morons, or
    - intelligent investigators?
  - need more skills, not fewer
  - automation can free testers to do more test design, exploratory testing
    - · and find more bugs
  - tools don't replace testers, they support them

**DG** 

- Automation should find lots of bugs
- Automation comes out of a box (or download)
- Let's automate all of our manual tests
- ROI is essential for automation.
- Testing tools are testers' tools

10

# Good idea? ROI is essential for automation

- · Seems very sensible
  - we will be spending time and possibly lots of money on tools – need to be sure it will be worth it
  - a "water-tight" business case will convince our managers to invest in automation
- Problems
  - ROI is not the whole story
  - people are not convinced by numbers
  - calculating ROI is difficult and can be dangerous

DG

### Is this Return on Investment (ROI)?

- tests are run more often
- tests take less time to run
- · it takes less human effort to run tests
- we can test (cover) more of the system
- we can run the equivalent of days / weeks of manual testing in a few minutes / hours
- faster time to market

ROI = (benefit - cost)
cost

these are (good) benefits but are not ROI

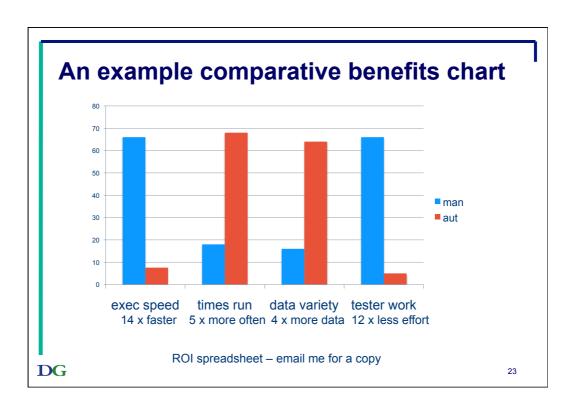

21

DG

#### How important is ROI?

- ROI can be dangerous
  - may give impression that people are replaced by tools (see http://dorothygraham.blogspot.co.uk/)
- "automation is an enabler for success, not a cost reduction tool" – Yoram Mizrachi
- many achieve lasting success without measuring ROI (depends on your context)
  - need to be aware of benefits (and publicize them)

**DG** 22

- Automation should find lots of bugs
- Automation comes out of a box (or download)
- · Let's automate all of our manual tests
- ROI is essential for automation
- Testing tools are testers' tools

Twitter: @DorothyGraham

# Good idea? Testing tools are testers' tools

- Seems very sensible
  - testers do testing testing tools help with testing
  - tools will make them better testers, because they will be able to run more tests, faster
- Problems
  - tools are software packages using programming languages; tester skills are different to development skills
  - spending time on / with tools means less testing, not more testing (initially at least)

**DG** 

25

#### Is it the tester's job to automate tests?

- test execution automation is software development
  - · needs programming skills
- not all testers want to become developers
  - · or would be good at it
- do automators need testing skills?
  - · helpful but not essential
- if testers are automators → a conflict of interest
  - do you run tests or do you automate tests?
  - automation is better long-term, BUT
  - deadline pressure pushes you back into manual testing

DG

### **Current thinking?**

- "Testers, if you want to have a job, you need to learn to write code"
  - so testers who don't write code are now worthless?
  - the only good tester is a developer-tester?
- I see serious consequences (and I don't agree!)
  - for every context? (user/business testers)
    - fine for those who want to, in agile team, dev level
  - pure testing skills are no longer valued?
  - not right to force good testers out of our industry!

DG

#### Why are these intelligent mistakes?

- Automation should find bugs?
  - tests find bugs; automated tests are still tests
- Automation comes "out of the box"
  - you think you buy a solution that will just work
- Automate all manual tests?
  - a starting point for tests to be automated
- Automation has to achieve ROI?
  - can't expect investment without showing some return
- Testing tools are tools for testers?

**DG** – testers write and run tests; tools run tests

### Why are these intelligent <u>mistakes</u>?

- Automation should find bugs?
  - tests find bugs, automation runs tests
- Automation comes "out of the box"
  - effort and time, e.g. tailor your testware architecture
- Automate all manual tests?
  - not all should be, automate more than manual
- Automation has to achieve ROI?
  - may be dangerous, need to show benefits
- Testing tools are tools for testers?

DG - different skills, not all testers should code

. .

#### **Summary**

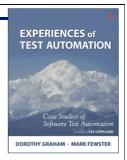

- Many ideas seem sensible at first / on the surface, but have serious problems
  - automation should find lots of bugs
  - automation comes out of a box (or download)
  - let's automate all of our manual tests
  - ROI is essential for automation
  - testing tools are testers' tools
- Recognise these "intelligent mistakes" and avoid them
