- **Top1: Mastering Verification Complexity**
  - Continuous increase in number of IP's and embedded processors
    - 2006: 30-40 IP's, 1 CPU
    - 2011: 80+ IP's, 6+ CPU's
    - *2016: 120+ IP's, 20 CPU's ?*
  - The more IP's the higher the risk of late spec & implementation changes
  - Driving towards true Hw/Sw Co-Verification
  - Reuse of verification environments / stimulus from IP-level into big multi-CPU SoC environments

## 2. Scalability

- **Constrained-random simulation has been proven as a good bug-hunting flow, but...**
  - How much simulation will be enough for a 10 GHz CPU?
  - How many cycles to verify 2 weeks at target speed of 1GHz?
    - Answer:  $0.6 \times 10^{15}$

	Simulation (KHz)	Emulation (1 MHz)	FPGA (10 MHz)	Si (1 GHz)
Target cycles $10^{15}$	1,000,000 sim slots	1000 emulation slots	100 FPGA slots	1 chip
Achievable cycles	$10^{11}$	$10^{12}$	$10^{14}$	$10^{15}$

- ***How will we scale simulation, emulation, FPGA to next gen of CPUs?***
- ***What are the alternatives?***

<b>Geoff Barrett, Broadcom</b>	<b>Scalability</b> <ul style="list-style-type: none"> <li>At chip level</li> </ul>	<b>Verification resources</b> <ul style="list-style-type: none"> <li>Too much on diversions</li> </ul>	<b>EDA Tool Maturity</b>

- **Verification engineers are always in demand**
- **Even with some industry-wide unification of methodologies finding good engineers doesn't seem to be getting easier**
- **With more design re-use and verification outsourcing flexible engineers seem harder to find**

<b>Geoff Barrett, Broadcom</b>	<b>Scalability</b> <ul style="list-style-type: none"> <li>At chip level</li> </ul>	<b>Verification resources</b> <ul style="list-style-type: none"> <li>Too much on diversions</li> </ul>	<b>EDA Tool Maturity</b>

- **MS verification made easy**
  - How do analogue and digital engineers work together?
  - Multitude of skills required
- **Boundary is fading**
  - Analogue verification incorporates digital techniques
  - Digital verification incorporates analogue features
- **Variety of modelling techniques and abstractions**
- **Power aware mixed signal verification**
- **UVM-AMS adoption**

- **The challenge to manage huge amount of verification data**
  - Amount of verification data make more complex the risk decision of verification closure
- **Some Directions partially or to be implemented**
  - Refine the verification Metrics
  - Merge the metrics (SOC / IPS – various source)
  - Usage of MySQL data Base
  - Leverage on Business Intelligence tool to support Verification Closure
  - Define metrics on non-functional properties (performance, power, energy, temperature, ...)

- **Required by ISO 26262**
  - “Road vehicles – Functional safety” and other similar standards
- **Validate the verification**
  - Have the right things been verified
  - Avoid that requirements haven't been verified and things have been verified, that haven't been required
- **Reuse implementation of verification goal**
- **Keep track with change requests**
- **Enable impact analysis**
